

Customer Need

The service provider was facing the need for the Provision of coverage to remote rural areas.

Offered Solution

The Frequency Shifting Repeaters that we offered are designed to solve problems of weak mobile signal, which can expand more coverage than RF Repeaters and reduce investment for the areas where fiber optic or dedicated cable is not allowed.

Our offered product supports Frequency Shifting in band so no licensing for microwave links is required.

Business Benefit

Sufficient Coverage provided to remote areas with no wireline network infrastructure that reduced CAPEX and OPEX costs related to new base station deployment. Coverage can be provided to all directions in contrast to standard repeaters. Remote Unit can be powered by Solar Panels.
